

SOLID SORT

Sorting solids by characteristics

Solids can be sorted by color, texture, size, shape, and other characteristics. You and a partner will sort a collection of solids without letting each other know by which characteristic you are choosing.

Step 1- Get the tub of objects and take to a place away from your partner. Explore the objects and decide how you will sort them. Sort the objects and wait for your partner to sort.

Step 2- Compare your sorting strategy with that of your partner. See if you can guess which characteristic your partner chose.

How did you sort the objects? _____

How did your partner sort the objects? _____

How would you sort your objects if you did it again? _____
